

Adding an External Repository to an SVN Project

cd into the directory where you want to add the external project, then type:

```
svn propedit svn:externals .
```

Once the editor opens, add the name of the directory you want to add the external project into, and the URL of the project. So, if I want to add the UcsfLdapPHP repo (but without the PHP at the end), then type the following:

```
UcsfLdap https://svn.library.ucsf.edu/repos/UcsfLdapPHP/trunk
```

Once you save the file, svn will output something like:

```
Set new value for property 'svn:externals' on '.'
```

At this point, you need to commit the current directory:

```
svn commit -m "Added UcsfLdap as an external project." .
```

Finally, do the following to check out the code:

```
svn update
```

Now the external project is part of the current project.
